Introduction to project

WEDDING PLANNER AND BUDGET TRACKER

ABOUT

This project is based on purpose of wedding planning and budget tracking

This website help user in planning a good plan for their wedding and tracking their budget at the same time. this includes information about the venues and vendors booking etc

Project Scope:

TO ENHANCE LEARNING:

This Educational project is designed to help students learn new concepts and skills in a more engaging and interactive way.

TO PROMOTE CREATIVITY

This Project encourage students to think creatively and come up with innovative solutions to problems.

TO DEVELOP CRITICAL THINKING SKILLS:

Projects require students to analyse information, evaluate evidence, and draw conclusions, which helps them develop critical thinking skills.

TO FOSTER TEAMWORK:

This educational project is collaborative, which helps students learn how to work

effectively in teams.

Responsive design:

This website is developed with a responsive design approach to ensure accessibility across various devices including tablets, mobile phones etc. CSS syntax is used to utilize and adapt the layout based on device screen.

Quality Assurance:

This includes testing for compatibility, usability. Feedback from potential users is collected using feedback form and used to make necessary improvements.

Technologies used:

The following technologies were used to create the website

- **HTML:** used to define the structure and content of a web page. Hyper Text Markup Language is the standard markup language for creating web pages. It is
- **CSS:**
Cascading Style Sheets is a language used to describe the presentation of a web page. It is used to control the layout, colours and fonts of a web page.

PROJECT IMPLEMENTATION:

The website was created using a variety of tools and software, including:

- **VISUAL STUDIO CODE:**
A text editor and integrated development environment (IDE) for building and debugging web applications.
- **LIVE SERVER:**
A tool that allows you to preview your web pages in a web browser while you are editing them.

The choice of technologies for this project was based on the following factors:

- **Suitability:** The chosen technologies are well-suited for creating informative and easy-to-navigate websites.
- **Popularity:** The chosen technologies are all popular and widely used, which makes it easier to find support and resources.
- **Maturity:** The chosen technologies are all mature and stable, which reduces the risk of problems.

MODULE

<DIV>

- The <div> element usually has no specific semantic meaning by itself, simply representing a division, and is typically used for grouping and encapsulating other elements within an HTML document and separating those from other groups of content. As such, each <div> is best described by its contents.

- **<section>**

Section tag defines the section of documents such as chapters, headers, footers or any other sections. The section tag divides the content into section and subsections. The section tag is used when requirements of two headers or footers or any other section of documents needed

- **Heading Tags:**

Headings can be used to describe the topic they precede and they are defined with the <h1> to <h6>. Headings support all the global attributes.

- **Anchor:**

Anchor tags are commonly used to link separate webpages, but they can also be used to link between different places in a single document, often within table of contents or even launch external applications

- A **<a href=" <http://example.com> " >** It creates a hyperlink, to the URL <http://example.com/> as specified by the href
- B **** Open link in new tab/window
- C **** Specifies the relationship between the current document and the linked document
- D **Callus** value of the href-attribute begins with tel: your device will dial the number when you click it. This works on mobile devices or on computers/tablets running software – like Skype or FaceTime – that can make phone calls.

-
- **:**
An ordered list can be created with the tag and each list item can be created with the In this tag I have used to create navigation bar button such as Home tab, Service Tab, About Tab etc.
- **<input>:**
The <input> tag specifies an input field where the user can enter data.
 - A <input type="button"> To add button of
 - B <input type="email"> To add email text field
 - C <input type="password"> To add Password field
 - D <input type="submit"> To add submit button
 - E Placeholder attribute the placeholder attribute specifies a short hint that describes the expected value of an input field
 - F Required attribute It used for mandatory to input something

1. <label>

The <label> [HTML](#) element represents a caption for an item in a user interface.

2. <footer>:

The <footer> [HTML](#) element represents a footer for its nearest ancestor [sectioning content](#) or [sectioning root](#) element. A <footer> typically contains information about the author of the section, copyright data or links to related documents.

:

The tag is an inline container used to mark up a part of a text, or a part of a document.

<ion-icon >:

- <ion-icon name="logo-google"> </ion-icon> To add Google logo
- <ion-icon name="logo-facebook"> </ion-icon> To add Facebook logo
- <ion-icon name="logo-skype"> </ion-icon> To add Skype logo

- `<ion-icon name="logo-instagram"> </ion-icon>` To add Instagram logo •
`<ion-icon name="logo-twitter"> </ion-icon>` To add Twitter logo

`<p>`:

To add Paragraph of a webpage

**`
`:**

To break line 13. **`<i>`** and

``:

To emphasize the text or paragraph

`` and ``:

To bold the text or paragraph.

•

CSS:

1. Background:

We use this property to add something related to the background such as

- Background: url () To add image on the webpage
- Background-size: cover Total cover of the webpage
- Background-position: center to add image on center of the webpage
- Background-position: right-top to add image on right top of webpage
- Background-position: right-bottom to add image right-bottom of the webpage
- Background-position-x: left to change the position in x direction

2. font-size: we used to increase or decrease of font size and the value added in px format

3. font-family:

We have used to this property to change the font of the text. Such as We have used “arial” text format in this webpage.

4. font-weight: bold: To bold the text

5. color:

It used to change the color of the text or paragraph

6. height and width:

The CSS height and width properties are used to set the height and width of an element

7. Padding:

CSS Padding is the space between the content and the border of an element. It adds spacing inside the element, controlling its internal space, thus affecting its dimensions and appearance.

- Padding-top: • Padding-left:
- Padding-right:
- Padding-bottom:
-

8. Margin:

The CSS margin properties are used to create space around elements, outside of any defined borders

- Margin-left: To add left of the margin
- Margin-top: To add right of the margin
- Margin-right: To add right of the margin
- Margin-bottom: To add bottom of the margin

9. Float:

The CSS float property specifies how an element should float.

10. Border:

- Border-style: solid continuous thin line border visible
- Border-style: dashed dashed line border visible
- Border-width: add some value in px to change the width of border
- Border-color: To change the color of border
- Border-radius: To make in circular format

8. Cursor: pointer

The cursor is a pointer and indicates a link

9. Transition:

10. Display:

- **Display: inline** Displays an element as an inline element (like). Any height and width properties will have no effect.
- **Display: inline-block** Displays an element as an inline-level block container. The element itself is formatted as an inline element, but you can apply height and width values
- **Display: flex** Displays an element as a block-level flex container

11. Transform:

The transform property applies a 2D or 3D transformation to an element. This property allows you to rotate, scale, move, skew, etc., elements.

12. Position: absolute:

The position property specifies the type of positioning method used for an element (static, relative, fixed, absolute or sticky).

13. List-style

- Set different list item markers for ordered lists
- Set different list item markers for unordered lists
- Set an image as the list item marker
- Add background colours to lists and list items

14. Justify-content

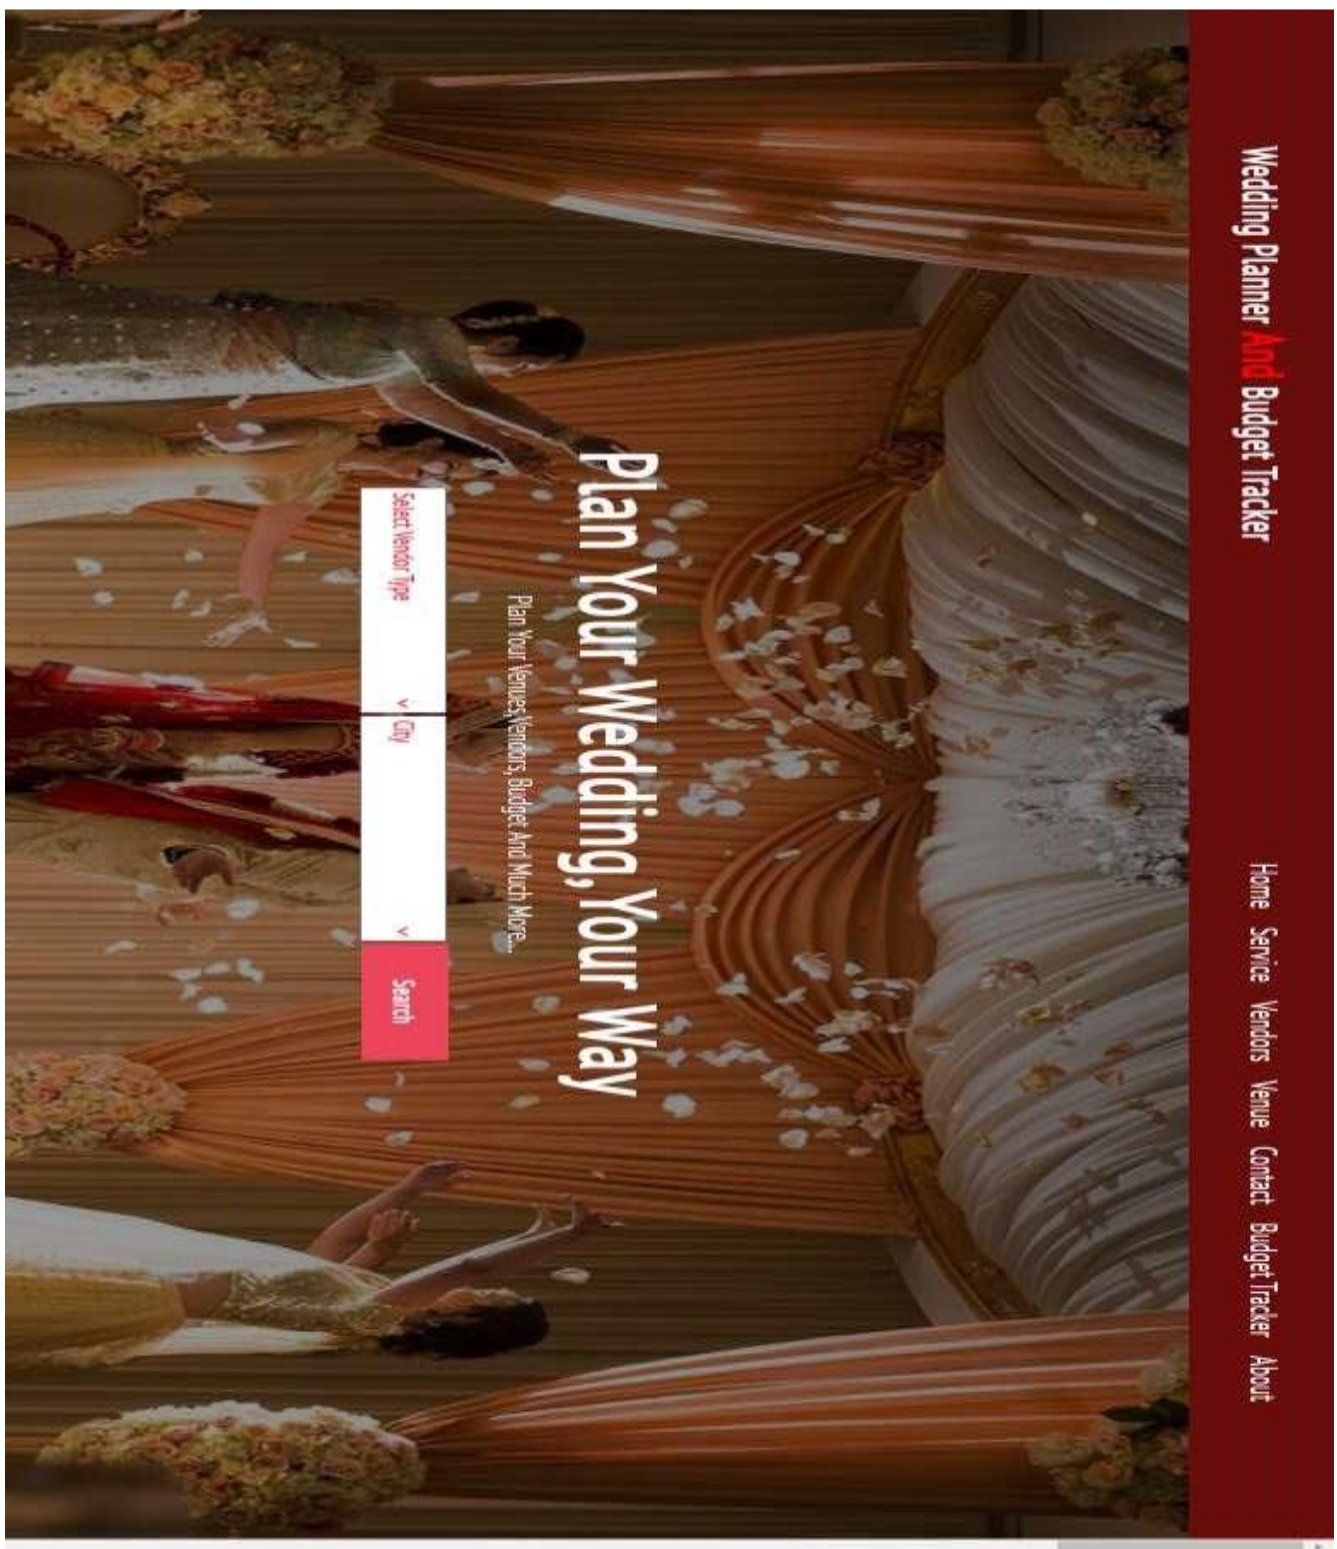

The justify-content property aligns the flexible container's items when the items do not use all available space on the main-axis (horizontally).

- **Justify-content: center:** Items are positioned in the center of the container.

18.Align-items:

The align-items property specifies the default alignment for items inside a flexbox or grid container. You can add normal, stretch, center, flex-start etc. as the value

The background image shows a wedding hall with a white draped ceiling, a large chandelier, and floral decorations. A white form titled "Wedding Budget Tracker" is overlaid on the image. The form contains a table with two columns: "Expense" and "Amount". Below the table is a form with two input fields: "Expense Name" and "Amount", followed by a green "Add Expense" button.

Expense	Amount
---------	--------

Expense Name

Amount
